ABSTRACT

Abstract

Technology has played a critical role in the development of the Indian banking industry, which has undergone significant changes over time. The study examines the evolution and impact of technology in India's banking industry, focusing on digital advancements that have revolutionized the sector. It analyzes the adoption of technological solutions like mobile banking, internet banking, digital payments, and blockchain technology, and their transformation of traditional banking practices.

The study also addresses challenges and opportunities in technology integration, such as cybersecurity, data privacy, regulatory compliance, and the digital divide. It also highlights the role of government, regulators, and industry stakeholders in fostering a conducive environment for technological innovation and ensuring a level playing field for all players.

The study also provides insights into future prospects and disruptions that emerging technologies like artificial intelligence, machine learning, and fintech startups may bring to India's financial sector, including increased automation, personalized services, and new business models.

Overall, the study offers a comprehensive analysis of how technology has transformed India's financial sector, its current state, challenges, and future outlook, and offers recommendations for policymakers and banking stakeholders.

Keywords: Technology, Sector, Digital, Exposure, Innovations.

1. Introduction

In the early 1990s, the Indian economy faced deficiencies in the financial and banking sectors, including poor productivity, efficiency, profitability, weak financial institutions, poor customer service, outdated technology, and inability to meet competitive challenges.

The government and RBI deemed it necessary to introduce reforms to promote rapid economic growth and stability through

globalization, liberalization, and privatization.

ICT has significantly impacted the banking industry worldwide, with the introduction of Advanced Ledger Posting Machines (ALPM) and Total Bank Automation (TBA) in the 1980s. This led to mechanized cheque processing systems using Magnetic Ink Character Recognition (MICR) technology.

Financial sector reforms and the internet facilitated banks to adopt centralized databases for all branches, leading to low-cost networks. New private and foreign banks adopted ATMs, phone banking, and internet banking early on.

Technology adoption enabled banks to create their own web pages for customers to access from their homes or workplaces. Online banking began in 1996, with usage increasing since 1999 due to lower ISP charges, increased PC penetration, and technology stabilization.

Electronic delivery channels include ATMs, debit/credit cards, mobile banking, and tele-banking, providing 24/7 banking services worldwide.

The establishment of INFINET in 1999 led to the introduction of the Real Time Gross Settlement (RTGS) system, ushered the concept of anytime-anywhere banking and compliance with the core principles of the Bank of International Settlements (BIS).

The researcher aims to investigate the performance of selected banks in the pre and post IT era and suggest strategies to enhance low performance in e-age banks.

Banks have evolved to improve customer service through branch automation, enabling them to connect branches, automate back-office functions, and facilitate information sharing without disrupting banking functions.

The 'Single Window Service' facilities delivered all banking services at a single counter, significantly reducing transaction processing times.

The banking sector embraced the IT revolution to develop interbank connectivity, emphasizing the importance of a centralized data infrastructure. This system allowed banks to explore multiple delivery channels, such as ATMs, net-banking, telebanking, and mobile banking.

FinTech, a new financial technology, offers financial services through innovative information and communication technologies.

The 4th industrial revolution has significantly impacted society, with the convergence of advanced technologies and entrepreneurship becoming more complex and computerized.

Banking has been one of the most challenged sectors, with new players like FinTech and Big Tech companies attempting to capitalize on these changes.

This study investigates the rapid expansion of FinTech and its impact on the Greek banking system using a questionnaire method with closed questions to collect data from main players, including consumers and employees.

Results show that customers of all ages trust traditional banks more than FinTech companies, while mobile transactions depend on age and education. Consumers express security as a top concern for FinTech companies, while bank employees' educational level is a critical factor in their readiness and response to new technologies.

As the industry enters the next digital revolution, traditional banks face stiff

competition from newer technology-driven start-ups and Fintechs.

New-age fintech challengers are rapidly dismantling the protective walls built up by incumbent banks in various sectors, including payments, cash, lending, money transfer, investment management, and lending.

Examples of how incumbents are being usurped include credit card/online payments being replaced by solutions from Apple, Amazon, Google, Paytm, WeChat, and Alipay.

Digital wallets replacing cash/cards and the need to visit ATMs are also being used. Real-time payment platforms and systems removing the need to use cheques or make online payments are becoming more attractive than conventional lending.

Peer-to-peer (P2P) lending platforms (e.g. Lending Club) becoming more attractive than conventional lending are also being challenged by challenger banks like Monzo and N26.

2. Overview of Bank and Technology

The banking industry is undergoing significant transformation due to technological innovations and changing customer behavior.

Fintech startups have revolutionized the industry by introducing innovative products and services that cater to a diverse customer base and promote financial inclusion.

Banks in India have been incorporating new technologies, such as ATMs, online banking, mobile banking, and point-of-sale machines, into their business and operations.

Digital banking has emerged as a result of increased consumer demand for more efficient ways to access banking services and complete financial transactions outside of local branches.

Fintech has significantly influenced the banking industry, with technologies like blockchain, cryptocurrency, and artificial intelligence (AI) shaping the future of banking.

The future of banking technology is driven by consumer demand, particularly from millennials and Gen Zers, who see technology as enhancing their lives.

New banking technologies are re-conceptualizing the industry, focusing on digitization and providing a seamless digital banking experience.

Technology adoption has played a crucial role in changing the face of banking in India, automating routine work processes, and enhancing operational efficiency.

Overall, technology has had a profound impact on the banking industry, driving innovation, improving customer experiences, and transforming traditional banking practices.

Purpose

The study explores the future of Indian banking, analyzing the impact of innovative technologies like cognitive technology, artificial intelligence, blockchain, robotics, and cybersecurity.

It highlights collaboration between banks and fintech companies, privatization, digitization, sectoral reforms, and the use of AI and robotics.

3. Literature Review

1. Neha Khurana (2018)

Neha Khurana conducted a study titled "A Study of Impact of Financial Technology on the Banking Sector in India," which was published in August 2018.

According to analysis, India is making quick strides in the Fintech industry, providing many opportunities for startups to enter the varied market.

With 40% of India's more than 600 Fintech startups, the most active segments are payments and lending.

The growth of the Fintech industry has helped the economy of the nation, but there are still issues with e-security and usage rates among the unbanked population.

These factors should not be used as an excuse to drop initiatives.

2. Meenakshi Rishi and Sweta C. Saxena (2014)

The research was published in February 2014 and was titled "Technological Innovations in the Indian Banking Industry."

According to the study's analysis, both public and private banks in India are undergoing a technological revolution as a result of their realisation that technology can aid them in

reducing expenses, boosting productivity, and surviving in a competitive market.

Public and private banks have established voluntary retirement programmes, prioritised retail banking, and offered fee-based services in an effort to increase profitability.

The Reserve Bank of India (RBI) must play a dual role in rewarding and punishing PSBs for unrestrained diversification and lax internal control.

3. Florian Diener and Miroslav Spacek (2021)

The article, "Digital Transformation in Banking: A Managerial Perspective on Barriers to Change," was released in February 2021.

This study combines qualitative findings with industry-best practices from the banking sector to assess digitalization and its challenges.

The results highlight the importance of exploratory methods and urge further study into the challenges and reasons for discrepancies between anticipated and actual responses to digitization.

Further investigation should focus on realistic transformation strategies, management perceptions of barriers, and banks' management of their digital transformation strategies.

A thorough normative model is advised, and primary and sub-barrier linkages should be statistically recorded for scientific and sectoral enrichment.

It is important to look into how digital transformation affects financial organizations' long-term growth.

4. Pooja Sharma and Dr. Sudipta Sen Gupta (2023)

The study, which was written by Pooja Sharma and Dr. Sudipta Sen Gupta and published in June 2023 in the Gyan Management Journal, was titled "Impact of Digitalization on Service Marketing in the Indian Banking Industry."

This study highlights the significant impacts of digitization on the banking industry while elucidating the beneficial relationship between numerous variables and the industry.

However, there are still issues with customers that have not been resolved that researchers have not addressed.

To make digitalization more risk-free and useful for customers, researchers should deepen their understanding of it and implement appropriate policies.

Digitalization is advantageous for service marketing because effective marketing increases customer satisfaction and loyalty.

A system's accessibility and tangibility have a direct impact on customer happiness.

5. Digital Banking Transformation Report (2023)

In 2023, this report's title was Digital Banking Transformation Report.

In addition to highlighting the positive link between digitalization and customer satisfaction, this research paper emphasises the significant impact of digitalization on the banking industry.

The study also emphasises the value of service marketing, which enhances client loyalty and satisfaction.

However, the percentage of African banks creating platforms independently is dropping,

with 87% depending on outside developers or using a hybrid strategy.

The transformation is being driven by the expanding selection of services, mobile apps, and digital lending, with customer demand and satisfaction being the most crucial elements.

Only half of African banks believe that digital transformation is the most critical element in growth strategies, despite the fact that the majority do.

6. Kavya J and Ramya Rakesh (2022)

Kavya J and Ramya Rakesh's study, titled "A Study on Customers Preference Towards Digital Banking in Modernity," was published in 2022 in the East Asian Journal of Multidisciplinary Research (EAJMR).

According to the article's conclusion, the majority of users of digital banking are reportedly extremely satisfied with it as long as it is useful and enables less complicated transactions.

Internet banking, digital payment services, debit/credit cards, and mobile banking are all frequently preferred by users, with mobile banking coming in second.

The banking industry should focus on security issues and provide individualised offerings to encourage people to use digital banking more confidently and comfortably.

However, due to connectivity, security, and transaction issues, customers may become discouraged from using online banking.

7. Yousif Hichaim Sultan Altaie and Safaa Tayyeh Mohammed (2020)

The 2020 article, written by Yousif Hichaim Sultan Altaie and Safaa Tayyeh Mohammed, was titled "The Role of Digital Banking Services in Enhancing Customer Trust."

This study examined how digital banking channels provide customers with convenience, safety, and cost savings.

Additionally, they offer a variety of deal and time options.

Digital banking services and customer trust show a positive correlation (0.831).

Banks should concentrate on advertising, build a secure digital ecosystem, and make clear the advantages of digital banking if they want to increase customer trust.

Additionally, stricter rules and laws need to be passed and implemented, and there needs

to be more of a focus on safeguarding customers from information security risks.

8. Lyubov Anatolyevna Petrova, Tatyana Evgenievna Kuznetsova, Sofya Anatolyevna Eremina, and Oleg Anatolyevich Kalachev (2020)

The authors reported their findings in their paper, "Digital Bank of the Future," published in January 2020.

The banking sector is evolving thanks to the entry of new businesses that focus on single services.

Greater regulation as a result of the 2008–2009 global financial crisis has been problematic for banks.

Implementing regulatory rules involves sizable direct costs, which could give emerging financial enterprises a competitive edge.

Regulation also prevents collaboration between different financial services.

By reducing operating costs in two crucial areas—moving communications to digital channels and automating routine tasks—digital technology can be used to solve these issues.

There will be winners and losers in the new digitalization trend.

9. Evdokimova Yulia Viktorovna, Shinkareva Olga Vladimirovna, and Bondarenko Anastasia Viktorovna (2018)

In 2018, the authors published an article titled "Digital Banks: Development Trends."

The study found that the social, economic, technological, and regulatory contexts are significantly impacted by digitalization.

It involves complete digitalization and data chain integration, which results in cost savings, digital goods and services, physical and digital assets, process transformation, collaborations, and improved customer service.

This optimization includes individualized, straightforward, and swift interactions with both current and potential clients.

The digitalization of society, the economy, and the banking sector has produced a number of advantageous effects, including improved service quality, quicker service delivery, satisfaction of customer demands, lower costs, and increased competitiveness.

10. Dr. Rachna Kalsan (2020)

In January 2020, the International Journal for Research in Engineering Application & Management (IJREAM) published an article by Dr. Rachna Kalsan with the title "Impact of Digital Banking in India: Trends & Challenges."

The study found that internal challenges, security, privacy, knowledge, and skilled management are challenges for digital banking.

Customers frequently have a negative perception of digitization, so banks must educate their clients and improve accuracy.

Internal barriers can include departments, employees, and clients in the banking industry as well as non-financial organizations like Google, Facebook, and Paytm.

To ensure that their organizational goals are served by their policies and strategies, banks must adapt as the demand for digitalization increases.

4. Research Gap

The study explores the impact of innovative technologies on the banking sector, but does not address the role of fintech and digital

financial services in promoting financial inclusion in India.

This research gap is significant, as fintech is crucial for expanding access to financial services and promoting financial inclusion.

Future research should explore the potential of fintech and digital financial services in promoting greater financial inclusion in India.

5. Objectives

1. To assess the state of technology adoption in the Indian banking sector.
2. To ascertain the effects that new technology adoption has had on the performance of the Indian banking sector.
3. To analyze current technology and innovation in the banking industry and to compare various bank technologies.
4. To assess the banking industry's estimated future growth rate and the impact of technology adoption on demographic factors.

6. The Evolution of Technology in Banking Sector

These technological developments have significantly increased banking accessibility,

efficiency, and security, which has enhanced consumer experience and changed the way banks work.

Over time, the banking business has seen a significant transformation due to technological advancements.

Following is a timeline of significant events:

1. Introduction of Computers

Banks started employing computers in the 1950s to automate a variety of functions, including transaction processing and account reconciliation.

This signaled the start of the banking industry's technological integration.

2. Electronic Funds Transfer (EFT)

It was first made available to clients in the 1970s, allowing for the electronic transfer of funds between accounts.

As a result, there was less demand for paper checks and other paper-based transactions.

3. Automated Teller Machines (ATMs)

Although they were first used in the 1960s, ATMs really took off in the 1980s.

Customers could use ATMs to withdraw cash, check account balances, and even deposit money while banks weren't open.

For clients, this technology increased accessibility and convenience.

4. Online Banking

Online banking had a remarkable expansion following the introduction of the internet in the 1990s.

Through secure websites, customers could now access their accounts, make transfers, pay bills, and view transaction history.

This made it unnecessary for regular transactions to be conducted in person at branches.

5. Mobile Banking

The banking sector underwent a change as a result of the early 2010 smartphone explosion.

Customers may carry out transactions, check account balances and manage their finances while on the road thanks to mobile banking applications.

Customers benefited from greater convenience and flexibility as a result.

6. Biometric Authentication

To improve security and speed up authentication procedures, banks have started utilising biometric technology like fingerprint scanning, facial recognition, and voice recognition.

This guarantees that only persons with permission can access their accounts and carry out transactions.

7. Artificial Intelligence and Chatbots

In order to provide individualized customer experiences, banks have used AI and machine learning technologies.

Customers can get help from chatbots with questions, account information, and even financial advice.

Additionally, AI systems examine client data to spot trends and provide personalized product recommendations.

8. Blockchain Technology

Blockchain, a decentralized and open ledger technology, has the power to completely change the banking industry.

It makes transactions safe and quick, lowers prices, gets rid of middlemen, and makes cross-border payments simple.

9. Open Banking

Customers can securely exchange their financial data with third-party applications via open banking.

As a result, competition, creativity, and the creation of new financial services and products are encouraged.

10. Digital Currencies

A substitute for conventional fiat currencies has developed in the form of cryptocurrencies like Bitcoin.

Despite the fact that the banking industry has only recently begun to incorporate cryptocurrency, certain banks have begun to offer services in this area.

7. The Recent Technologies Adopted in the Indian and International Banking Sector

- The Indian banking sector is leveraging the Internet of Things (IoT) to enhance customer experience, security, and operational efficiency. IoT devices can monitor customer behavior, detect fraud, and automate processes.

- Indian banks are investing heavily in digital banking, including mobile banking, online banking, and digital wallets.

- Customer experience (CX) trends in India include adopting new technologies like intelligent decision-making, open banking APIs, embedded solutions, cloud computing, metaverse banking, and cybersecurity.

- The entry of fintechs and big tech into retail banking has led to an increased focus on improving customer experience and competitiveness.

- The India Stack is a digital infrastructure that widens access to finance in India, including interoperable payments, digital wallets, and mobile money.

- Technology investments are crucial for banks to capitalize on and create value, aiming to improve customer experience, optimize operations, and stay competitive.

- International banks utilize robotic process automation (RPA) to streamline repetitive tasks, enhance operational efficiency, and reduce costs, encompassing data entry, compliance checks, and client onboarding.

8. The Impact of New Technology Adoption in the International Banking Sector

1. Improved Customer Experience

Customer experience has been improved through the introduction of new technology, which has made banking services more convenient and secure.

Banking has become more obtainable and user-friendly because of technologies like mobile banking, digital wallets, and chatbots driven by AI.

2. Improved Effectiveness

By implementing cutting-edge technology like blockchain, open banking APIs, and cloud computing, banks have been able to increase their efficiency.

Banks may now streamline operations, cut expenses, and enhance data security thanks to these innovations.

3. Improved Security

The banking industry's security has improved as a result of the use of new technology.

Blockchain and biometric authentication technologies have increased the security of

transactions and decreased the likelihood of fraud.

4. Regulatory Environment

The regulatory environment for banks is changing as a result of the deployment of new technology.

Regulators are increasingly concerned with making sure that banks can control the dangers posed by new technology and safeguard client information.

5. Increased Competition

Competition has grown stronger for traditional banks as a result of the advent of fintechs and big tech into the banking industry.

In order for banks to remain competitive, this has led to a greater focus on client experience and innovation.

Article 4.pdf

Part 3 of 4 – Methodology and Statistical Analysis

9. The Recent Technological Scenario of the Indian Banking Sector

Robust Demand

FinTechs and neobanks are gaining ground, according to the EY 2021 NextWave Global Consumer Banking Survey, which examined consumers' primary financial interactions.

When it comes to the crucial necessity for securing consumer data, where incumbent banks have a trust advantage, that demand seems especially high.

For access to banking licences and to satisfy other regulatory criteria, certain super applications might also turn to banks.

The third-largest FinTech ecosystem worldwide is found in India.

Innovation in Service

The extension of financial services has recently seen notable gains in efficiency, productivity, quality, inclusion, and competitiveness, particularly in the field of digital lending.

The Reserve Bank and the Reserve Bank Innovation Hub (RBIH) collaboratively conceptualized the digitalization of agri-finance.

This will make it possible to deliver Kisan Credit Card (KCC) loans in a hassle-free, entirely digital manner.

The KYC procedure will be shortened in Union Budget 2023 by employing a "risk-based" strategy rather than a "one size fits all" method.

Business Fundamentals

The use of digital payment methods has increased dramatically in recent years.

As a result, the volume and value of payments made using traditional paper-based instruments like checks and demand draughts have decreased significantly.

Policy Support

The RBI has started a pilot programme to digitalize KCC lending in an effort to increase efficiency, save money, and shorten turnaround times.

This is anticipated to change how credit is distributed to the rural sector.

The RBI began a trial programme for central bank digital currency (CBDC) in November 2022.

10. Research Methodology

For this study, information was gathered using primary data. Convenient or random sampling, however, is the method used in this study.

100 sizes of data were present. Collected data using a Google form.

Secondary data was also gathered from a variety of publications, including journals, conference reports, articles, and formal notifications published on the official website by authorized departments.

Future banking prospects and how technology is affecting the banking sector are the study's main topics.

The data was gathered from a variety of bank customers of:

1. Kotak Mahindra Bank
2. Karnataka Bank Ltd.
3. Canara Bank
4. Bank of Baroda
5. State Bank of India
6. Central Bank of India
7. City Union Bank

8. Other banks with branches specifically in Bangalore South.

The study provides information on the banking industry's past, present, and projected technological development.

Use of the Chi-square statistical test was the technique employed to analyze the study.

A chi-square test is a statistical test used to compare observed results with expected results.

11. Annual Growth Rate of Banking Industry

The following table indicates the annual increase growth of banking industry.

Financial Year	Growth Rate
2018	7.14%
2019	7.10%
2020	8.07%
2021	9.55%
2022	9.70%
2023	15.40%

Forecasted Growth Rate for 2024 and 2025

Year	Growth Rate
2023	15.40%
2024	15.37%

2025	16.95%
------	--------

Trend Analysis

The banking industry experienced annual growth rates from 2018 to 2023, starting at 7.14% in 2018.

It then increased to 7.10% in 2019, 8.07% in 2020, and 9.55% in 2021 and 9.70% in 2022.

The highest growth rate was 15.40% in 2023.

The industry is expected to slightly decrease in 2024 to 15.37%, but in 2025, it will reach 16.95%.

This indicates a positive outlook for the industry, with a slight decline followed by a significant increase.

The highest growth rate was recorded in 2023, indicating a consistent trend of growth.

The forecasted growth rates for 2024 and 2025 suggest a positive outlook for the industry.

12. Hypothesis – 01

H₀: There is no significant difference in technology innovation and execution have improves customer service, cost benefit, and time saving across different age groups.

H₁: There is a significant difference in technology innovation and execution have improves customer service, cost benefit, and time saving across different age groups.

Table shows the significance of independent variable as age group whereas, dependent variable as:

"In Banking sector, technological innovation and execution have improved customer service, satisfaction, and reduced cost."

Test of Homogeneity of Variances

Variable	Levene Statistic	df1	df2	Sig.
Customer Service	1.48	4	95	0.215
Reduce Cost	0.378	4	95	0.824
Time Saving	0.271	4	95	0.896

ANOVA

Variable	Source	Sum of Squares	df	Mean Square	F	Sig.
Customer Service	Between Groups	9.123	4	2.281	1.538	0.198
	Within Groups	140.917	95	1.483		
	Total	150.04	99			
Reduce Cost	Between Groups	4.162	4	1.04	0.908	0.463
	Within Groups	108.838	95	1.146		
	Total	113	99			
Time Saving	Between Groups	4.772	4	1.193	0.825	0.512
	Within Groups	137.338	95	1.446		
	Total	142.11	99			

Interpretation

The data is from a test of homogeneity of variances, comparing three groups: Customer service, Reduce cost, and Timesaving.

The Levene statistic measures the difference in variances between the groups.

The significance level (Sig.) indicates the probability of obtaining the observed Levene statistic under the null hypothesis of equal variances.

The Customer service group has a significance level of 0.215, while the Reduce cost and Timesaving groups have corresponding significance levels of 0.378 and 0.271, respectively.

The study analyses three independent variables: customer service, reduce cost, and time saving.

The data is divided into between and within groups.

The mean square for customer service is 2.281, while the mean square for reduce cost is 1.040.

The F-statistic is 1.538, with a significance level of 0.198.

The mean square for time saving is 4.772, and the mean square for reduce cost is 1.040.

The F-statistics are below 1, indicating no significant difference between the groups.

The p-values for all three variables are greater than 0.05, indicating no statistically significant differences.

In conclusion, the ANOVA analysis shows no significant difference between the groups for customer service, reduce cost, and time saving.

Whereas, H_0 is accepted and H_1 is rejected.

Part 4 of 4 – Results, Conclusion and References

13. Gender-wise Analysis

The table represents the information about:

"Did Internet technology offer more opportunity to build a distinct strategic position than other traditional forms of banking services?"

Gender	Particular Responses	Number
Male	Strongly Agree	10
Male	Agree	22

Male	Neutral	6
Male	Disagree	0
Male	Strongly Disagree	0
Prefer not to say	Agree	1
Female	Strongly Agree	8
Female	Agree	35
Female	Neutral	17
Female	Disagree	1
Female	Strongly Disagree	0
Total		100

Interpretation

The data shows that both males and females have a positive perception of internet technology as providing more opportunities to build a distinct strategic position in banking services.

Approximately 62.5% of male respondents believe that internet technology offers more opportunities to build a distinct strategic position, while 86% of female respondents believe it offers more opportunities.

No male respondents disagreed or strongly disagreed, indicating a unanimous positive perception.

However, one respondent from the "prefer not to say" category agreed, suggesting an overall positive perception.

Interestingly, 36% of female respondents did not strongly agree or disagree with the statement, indicating a positive perception.

Overall, both genders perceive internet technology as providing more opportunities to build a distinct strategic position in banking services.

14. Results and Discussion

The banking industry has seen significant growth from 2018 to 2023, with the highest rate recorded in 2023 at 15.40%.

The industry is expected to slightly decrease in 2024 to 15.37%, but reach 16.95% in 2025, indicating a positive outlook.

A study comparing customer service, reduce cost, and time saving showed no significant difference between the groups.

Both male and female respondents have a positive perception of internet technology as providing more opportunities to build a distinct strategic position in banking services.

Approximately 62.5% of male respondents believe internet technology offers more opportunities, while 86% of female respondents believe it offers more.

However, 36% of female respondents did not strongly agree or disagree with the statement, indicating a positive perception.

15. Conclusion

From the reference of the above study detailed study the conclusion was drawn:

The study explores the impact of robotic process automation (RPA) on the international banking sector, highlighting its significant impact on customer experience, effectiveness, and security.

The adoption of new technology has led to improved efficiency, productivity, quality, inclusion, and competitiveness in financial services, particularly in digital lending.

India has the 3rd largest FinTech ecosystem globally, and technological innovations have improved efficiency, productivity, quality, inclusion, and competitiveness in financial services, particularly in the area of digital lending.

The banking industry has experienced significant growth from 2018 to 2023, with the highest rate recorded in 2023 at 15.40%.

The industry is expected to slightly decrease in 2024 to 15.37%, but reach 16.95% in 2025, indicating a positive outlook.

Both male and female respondents have a positive perception of internet technology as providing more opportunities to build a distinct strategic position in banking services.

1, FUNDING STATEMENTS:

This research received no specific grant from any funding agency in the public, commercial, or not-for-profit sectors

2. Conflict of Interest Statement:

The authors declare no conflict of interest with respect to the research, authorship, or publication of this article.

3. Ethics Approval:

Ethics approval was not required for this study as it did not involve human/animal subjects.

4. Informed Consent:

Yes, informed written consent was obtained from all participants.

5. Data Availability Statement:

The data that support the findings of this study are available upon reasonable request from the corresponding author.

6. Author Contributions (Credit Statement):
